eStratos 1.7 - 3.0 m³

Spreader

The eStratos 1,7 - 3,0 m³ is an innovative and sustainable spreader that has been specially developed for winter maintenance of small areas as well as municipal, country and national roads. With a combination of advanced high-tech electric drive technology and proven hydraulic technology, the eStratos offers a reliable and efficient solution for winter service. The standard battery capacity allows operation with two full hoppers, making it particularly powerful and environmentally friendly.

Highlights

- **Lithium-ion battery technology with integrated heating system**, specially developed for use at low temperatures.
- The standard battery capacity enables **spreading operations with two full hoppers** without recharging.
- **Integrated charger:** Only requires a 230 V AC connection, no separate installation required at the depot.
- Proven technology with **reliable hydraulics** and **high-tech electrical engineering**.

Your benefits

- **Sustainability:** The eStratos operates almost silently and is emission-free.
- **Powerful:** The eStratos delivers full power without affecting the energy consumption of the carrier vehicle.
- **Retrofittability:** This technology is suitable for retrofitting and converts existing spreaders into completely emission-free electric spreaders.
- **Easy maintenance:** The safe 48 V DC system enables maintenance work to be carried out without special training or special safety measures.

We know how important it is that your machines and equipment are always ready to deploy. **Get in touch with us** about our range of tailored services and original spare parts.

Performance features

Sustainable electric drive

The eStratos is equipped with a front-mounted battery pack (6.2 / 12.4 / 18.6 kWh, 48 V) and an electric motor. The powerful batteries enable two spreading operations with two full hoppers each without recharging. Thanks to the integrated charger, the eStratos can be charged at any 230 V AC connection. The lithium-ion battery technology with integrated heating system is specially designed for use in temperatures down to -20°C. Thanks to the use of hydraulic technology, the eStratos achieves the same performance as conventional hydraulic machines. It retains its full performance and is not affected by the limited power of the carrier vehicle. When used on an electric carrier vehicle, the range of the carrier vehicle remains unchanged. Compared to a motorised spreader, the eStratos is significantly quieter. In addition, the safe 48 V DC system can be maintained without special training or safety measures.

Mounting and demounting systems

Each of the spreaders can be equipped with one of three mounting and demounting systems:

- Base frame for demounting legs or fixed mounting
- RoRo (roll on - roll off) system suitable for full demounting

Dosage and conveyor systems

Pre-wet equipment

The spreader is equipped with laterally-arranged brine tanks with a liquid level indicator and a brine pump with run-dry protection, while a rear-side Storz C connection is available for filling and emptying the brine tanks. The suction point is located in the middle of the tank, which makes operation in inhospitable mountainous regions possible without problem. When switching on the brine, the dry material is automatically reduced and the distribution system settings are optimised in accordance with the change in composition of the de-icing agent. The system achieves a high level of accuracy, thanks to integrated sensors for comparison of the actual versus the target value of the control loops.

Distribution systems

The highly developed premium mixing system of the Stratos series 4 - 12 m³ is also used here. The best possible material flow is ensured by a polyethylene discharge chute and an optimised outlet angle. The spreading material hits the spreading disc centrally and is optimally distributed until it is discharged. This creates a homogeneous mixture, which is dynamically discharged as a bundled ejection jet in such a way that the effects of the wind are compensated for as much as possible.

The swivelling technology of the spreading disc enables the symmetrical or asymmetrical spreading pattern to be adjusted manually or electronically via the control panel. Thanks to this technology, the size of the spreading area is maintained, with a precisely defined spreading pattern and a spreading width of 2 - 10 m or 3 - 12 m.

New in the range are the Premium PW50 spreading discs which allow a 2 - 6 m or 2 - 8 m width to be spread with an PW50 mix.

Control and information systems

The Schmidt EvolutionLine comprises two different operating concepts that make work easier and more efficient. Thanks to this sophisticated control technology, the driver can control all functions conveniently from the cab and thus react directly to changing road conditions. Depending on the equipment level, temperature-dependent dosing is available with ThermoLogic or routes can be planned in advance via Route Assistant.

If you want to monitor, plan, control in real time, optimise or, for example, bill third parties for the activities of your Stratos, then use the digital solutions on our IntelliOPS platform. IntelliOPS supports you in the efficient use of your individual machine as well as in a network with several machines, including those of other brands. Here you can find out more about our digital solutions and how you can use them in a way that is modular and adapted to your needs.

Variants

Stratos 25

The eStratos 25 is a silo spreader with a hopper capacity of 2.5 m³.
